### **Abstract**

*Simulation Modeling of work regimes of solar power plants (SPP) and medium voltage (MV) network with them is executed. The influence on quality of electrical energy in a point of common connection (PCC) in dependence from power plants parameters and point of common connection deployment in the distribution MV network, as well solar power radiation level is defined. References 2, figures 4.*

**Key words:** quality of electric energy, solar power plant, distribution network.
