Abstract

The organizational basis and functions of the balancing group of the Guaranteed Buyer are considered as the main mechanism for implementing the state program to support the development of producers with renewable energy sources. The main advantages and disadvantages of such objects in terms of their influence on the pricing processes in organized segments of the electricity market of Ukraine are analyzed. The general approaches to solving problems arising in the face of increasing the share of electricity production from renewable sources in Ukraine are identified. Approaches to the means for analyzing the factors affecting the volumes supplied by stations with renewable sources on the pricing in organized segments of the electricity market of Ukraine are proposed. References 4, figure 1.

Key words: guaranteed buyer, renewable energy sources, electricity market, comparative analysis, simulation model.
